## **EXECUTIVE SUMMARY**

This air quality impact study has been completed to determine the air quality impacts associated with the development of the proposed project.

The Project known as "Ocean Breeze Ranch" envisions providing a total of 396 single-family residential units including 381 single-family detached small lots and 15 estate sized single-family lots and would build local parks and set aside approximately 833 acres for biological preservation and conservation along with approximately 10 acres of right-of-way dedication along West Lilac Road and a 30 acre vacant remainder parcel. The project also seeks to obtain a Major Use Permit (MUP) for an existing equestrian facility has been operational since about 1980 and is considered part of the baseline conditions. The existing facility is an estimated 375 acres, the proposed MUP would reduce the size of the operations to approximately 203 acres and would require some improvements to include permitting additional horse shade structures, a horse aquatic therapy pool, relocating employee manufactured homes and as well as an equipment maintenance shop. The equestrian facility would also make road improvements to bring the existing facility up to code with County road and fire code requirements. All improvements are proposed within the existing footprint of the equestrian facility and no expansion of the overall footprint, or increase in intensity of use, is proposed. Since the equestrian facility is an existing use and intensity is not increasing, the proposed modifications would be allowed under CEQA without further analysis.

The Project is located at 5820 West Lilac Road, south of State Highway 76, and approximately 1-mile west of Interstate 15. The Project is located in the northern portion of the unincorporated community of Bonsall in north San Diego County, CA.

All construction phases of the proposed Project are anticipated to start in 2022 and completion is expected in 2029 with full operations in 2030. The proposed Project will utilize Tier 3 or better construction equipment with diesel particulate filters (DPF) during construction.

Project design features (PDFs) have been included in this Project. The applicant has agreed to implement all PDFs and will be included in the Project's Conditions of Approval. The following PDFs applied in this analysis with the purpose of reducing air emissions include.

- Project-related construction activities would use Tier 3 or better construction equipment with DPF United States (U.S.) Environmental Protection Agency (EPA)/ California Air Resources Board (CARB)-certified construction equipment with diesel particulate filters. The Project developer has confirmed commitment to this feature.
- The Project will utilize architectural coatings compliant with San Diego Air Pollution Control District (SDAPCD) Rule 67 (SDAPCD, 2015).

- As a design feature, the proposed project would utilize no more than 6 tons of ammonium nitrate daily during any particular blast and would not blast an area greater than 20,000 SF per day.
- The Project will provide disclosures to future residents that the existing Equestrian Facility operations may cause agricultural odors typical of equestrian uses.
- Install high-efficiency Light Emitting Diode (LED) street and area lighting to achieve reduction in overall lighting energy.
- The Project will only install Natural Gas fireplaces within all 396 residential units.
- In accordance with the California Integrated Waste Management Act (AB 939), and to be consistent with AB 341's statewide 75% diversion policy, the project will seek to also achieve a 75% diversion goal by providing areas for storage and collection of recyclables and provide literature promoting recycling to achieve additional waste diversion.
- The Project applicant will be required to comply with County's Water Conservation in Landscaping Ordinance and demonstrates a 40% reduction in outdoor use, and will submit a Landscape Document Package to show such compliance. A 20% reduction was assumed within emissions modeling to be conservative
- Install low flow indoor water fixtures in all residential units.
- Plumb and install a single Level 2 electric vehicle (EV) charging station in each of the 396 residential units.
- The Project will install 1,973 KW of PV which is equivalent to 6,577 300-watt panels or an average of 16.6 panels per home.

All construction phases of the proposed Project are anticipated to start in 2022 and full buildout is expected in 2029 with full operations expected in 2030. As identified above, the proposed project is committed to using Tier 3 or better equipment with DPF attached which would minimize health risk impacts to less than 10 in one million exposed.

The only source of odors during construction would be from temporary construction equipment or paving equipment. Since odors would-be short-term events, a less than significant odor impact is expected during construction.

The proposed project site has an existing equestrian use which will continue to operate as a separate facility. These equestrian activities will generate equestrian odors which cannot be avoided. Each residential unit sold within the project site will require full disclosure in perpetuity of any equestrian activities adjacent to the project site. The equestrian use currently follows all applicable odor and vector control guidance by both San Diego Air Pollution Control District and the County of San Diego and will continue throughout the Ocean Breeze Ranch project life. Additionally, it should be noted that residential uses are not typically considered odor generators.

Based upon the analysis of construction and operation activities for the proposed project, direct operational or direct construction impacts would not be expected. The proposed project would generate less than significant cumulative impacts.

The Project property has multiple zoning and land use designations and the proposed project would be consistent with overall densities allowed by the General Plan for the site. The Project seeks a major use permit for the residential uses and one for the equestrian uses which will formalize the operational requirements for each set of uses. The Project's overall buildout is 396 residential units which is consistent with the existing General Plan Land Use Designations allowing up to 402 units. Additionally, pursuant to the County's Zoning Ordinance, a Planned Development may propose a project with lot sizes and criteria different from the underlying zoning, in order to preserve natural resources. This project meets that definition, and seeks approval of a Major Use Permit to authorize the proposed site plan.

The environmental impact report for the General Plan analyzed the impacts of all growth projected under the General Plan. The project is consistent with all applicable General Plan policies and has been designed to implement all applicable General Plan mitigation measures related to air quality. Because the project is consistent with the projected growth of the General Plan and with the applicable General Plan air quality policies and mitigation measures, the project will not result in a significant cumulative impact to air quality. Therefore, the project would be consistent with the Regional Air Quality Strategy (RAQS) and State Implementation Plan (SIP).

## **1.0 INTRODUCTION**

### **1.1 Purpose of this Study**

The purpose of this Air Quality study is to determine potential air quality impacts (if any) that may be created by construction, area, or operational emissions (short term or long term) from the proposed Project. Should impacts be determined, the intent of this study would be to recommend suitable mitigation measures to reduce impacts to the extent feasible.

### **1.2 Project Location**

The Ocean Breeze Ranch Project (Project) is a proposed residential community located in north San Diego County, in the unincorporated community of Bonsall. The property consists of 1,402.52 acres and is located at 5820 West Lilac Road, south of State Highway 76 and the San Luis Rey River, and west of Old Highway 395 and the Interstate 15 freeway. A general Project vicinity map is shown in Figure 1-A of this report.

### **1.3 Project Description**

The Project envisions providing 396 single-family detached lots of which 15 lots will be estate-sized or 5-acres or larger lots. The Project proposes a Tentative Map to develop approximately 312 acres of the site for residential uses which would include approximately 16 acres of local parks which would be designed for use by the development and the public. Additionally, the Project proposes to dedicate and conserve approximately 833 acres for biological preservation on-site along with approximately 10 acres of right-of-way dedication along West Lilac Road and a 30 acre vacant remainder parcel. The proposed Project would include the demolition of a small home and a barn that are roughly 6,000 square feet (SF) combined. The Project site plan is shown in Figure 1-B.

The project would also include a privately-owned equestrian facility on approximately 203 acres. The equestrian facility is an existing use occupying 375 acres. The equestrian facility would be formalized going forward by way of an MUP which would both allow the existing uses as well as permitting additional facilities: horse shade structures, a horse aquatic therapy pool, relocated employee manufactured home, and a relocated equipment maintenance shop. Improvements will be necessary to selected internal existing roads, in order to establish fire/emergency access routes meeting county fire code requirements. The proposed Project would include the preservation and continued use of the five residential units, two mobile homes, barns, and various accessory buildings existing on-site. All improvements are proposed within an area smaller than the existing footprint of the

equestrian facility and no expansion of the overall footprint, or increase in intensity of use, is proposed.

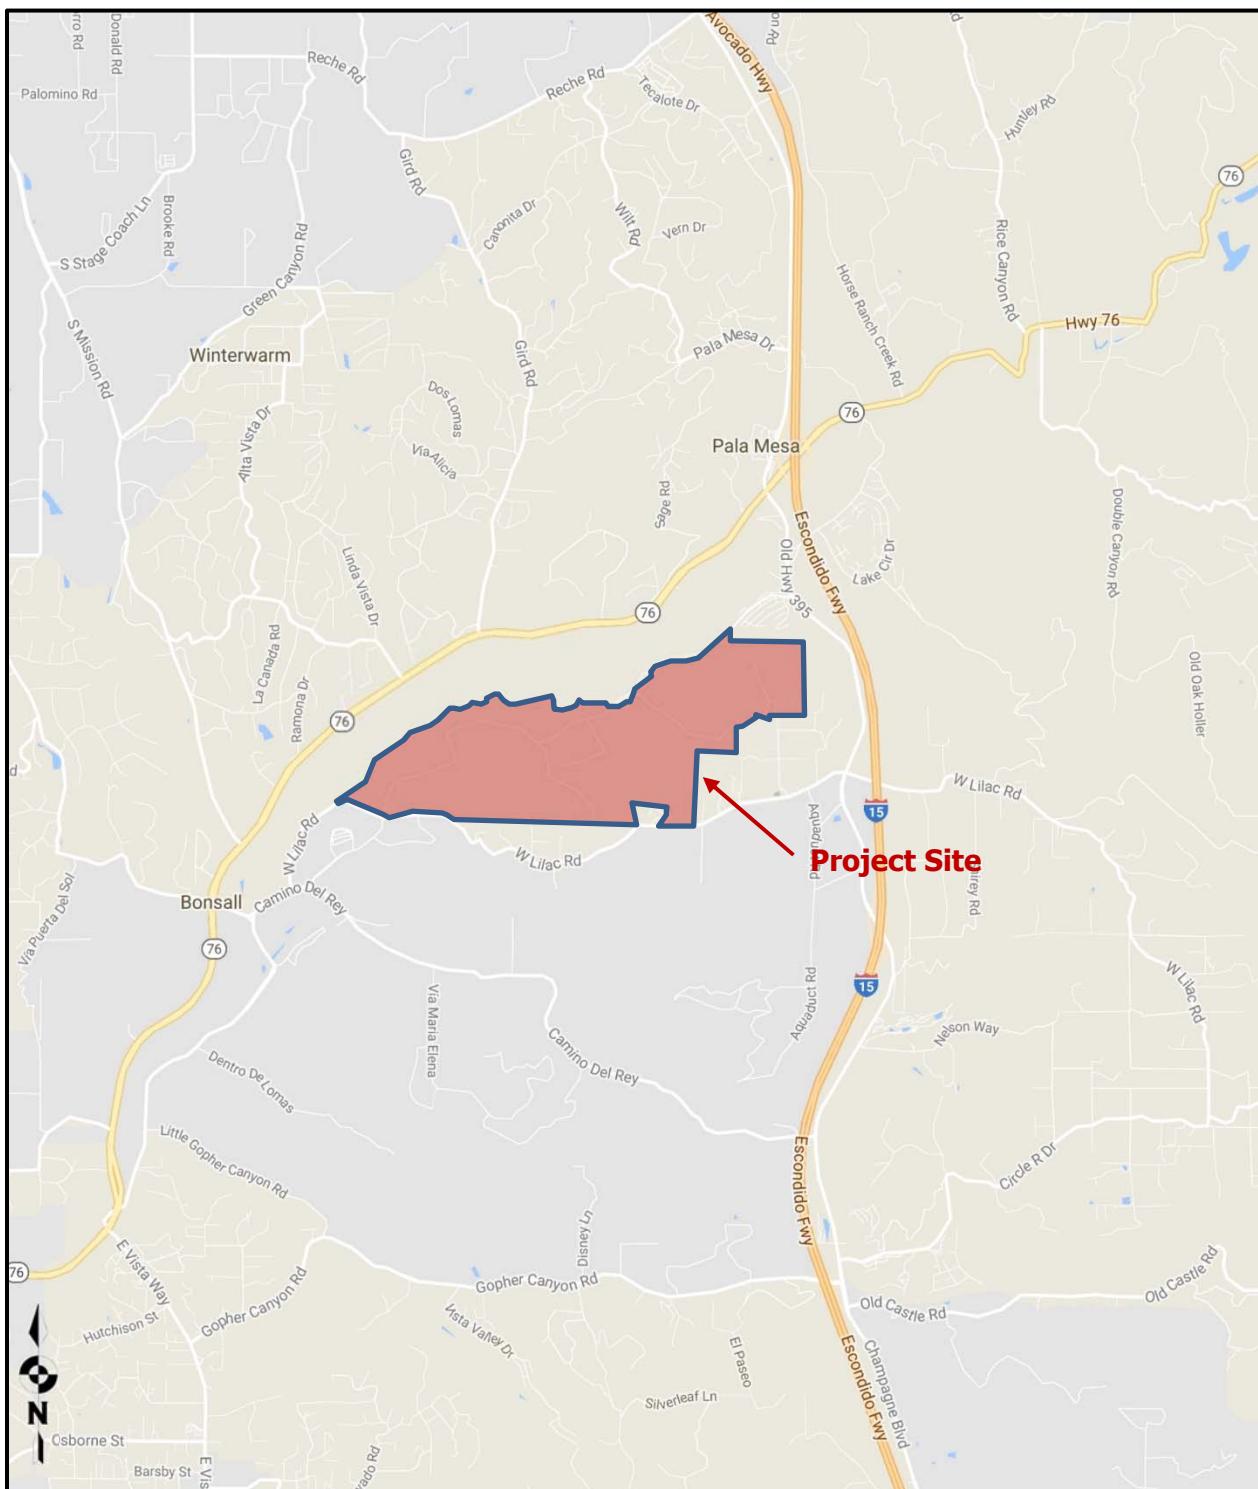

Construction of the Project would be expected to begin in 2022 with completion expected in 2029. The first full year of operations is expected in 2030. (The project would also require some blasting-related activities; as such, the project's air quality study estimated the criteria air pollutants associated with blasting. Of relevance to this analysis, blasting-related activities would utilize ammonium nitrate with fuel oil (ANFO) based explosives. When ANFO detonates, the blast would produce both CO and NOx (EPA, 1995).

#### 1.4 Project Design Features

Project design features (PDFs) have been incorporated into the Project to reduce emissions associated with construction, energy use, area sources and water demand. The project would include numerous PDFs that would reduce air emissions though not all are included within the air quality modeling software due to limitations of the software. Given this, PDFs are broken out to include the following within this analysis. Since these specific PDFs are shown in modeling software, they shall therefore be considered a condition to approval by the County.

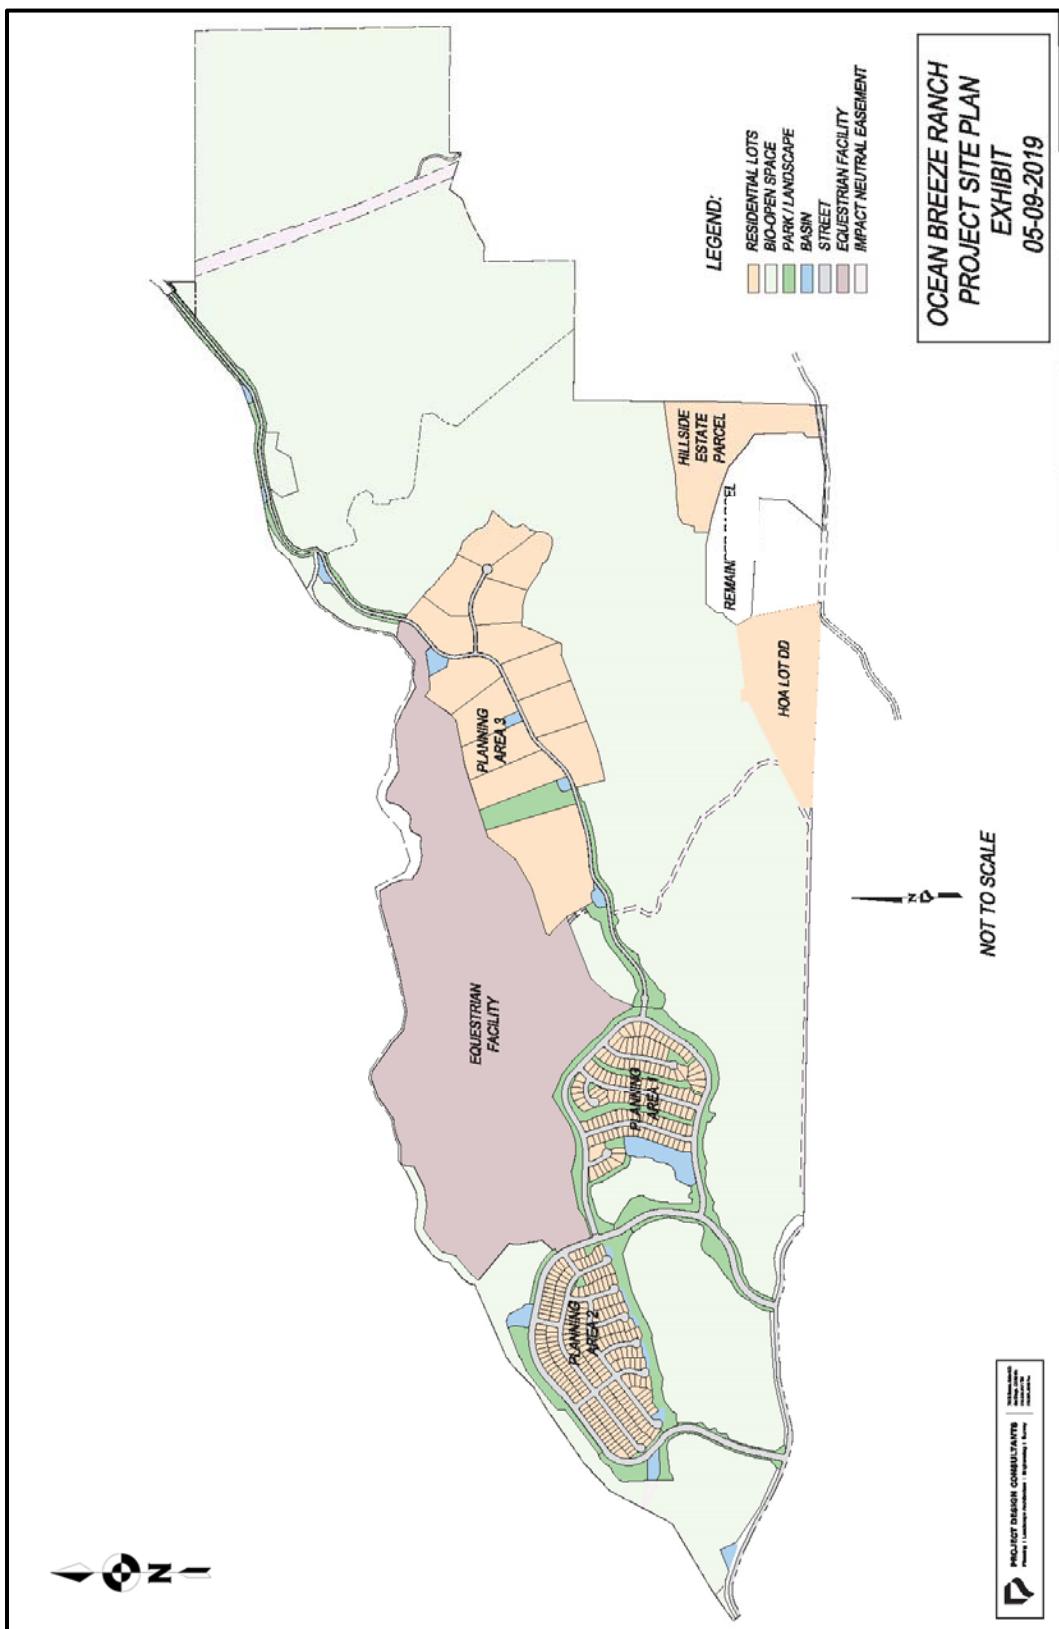

- Project-related construction activities were assumed to use Tier 3 or better United States (U.S.) Environmental Protection Agency (EPA)/ California Air Resources Board (CARB)-certified construction equipment with DPF and was modeled as such within this analysis.
- As a design feature, the proposed project would utilize no more than 6 tons of ammonium nitrate per blast and would not blast an area greater than 20,000 SF per day.
- The Project will only install Natural Gas fireplaces within all 396 residential units.
- The Project will provide disclosures to future residents that the existing Equestrian Facility operations may cause agricultural odors typical of equestrian uses.
- The project will utilize architectural coatings compliant with San Diego Air Pollution Control District (SDAPCD) Rule 67 (SDAPCD, 2015).

**Figure 1-A: Project Vicinity Map**

Source: (Google, 2018)

**Figure 1-B: Proposed Project Site Layout**

The project will also install PDFs geared to reduce greenhouse gas emissions which will not significantly reduce project operational air quality emissions and are not quantified or further discussed within this report. It should be noted that these design features are for informational purposes to this air quality report only since modeling results would not be dependent on installation of these PDFs.

- Installation of solar/photovoltaic system on each dwelling unit within the Project.
- Landscaped and screened parking areas consistent with the County's Parking Design Manual, including Section 7 (Landscaping) and the "cool parking" mitigation requirements identified by the CARB.
- Plumb and install every residential unit with a Level 2 electric vehicle (EV) charging station.
- Building efficiency features such as High-Efficiency HVAC system, tankless water heaters and Low E dual pane windows.
- Incorporate into Project Covenants, Conditions & Restrictions (CC&Rs) requirements that the HOA coordinate with SANDAG to provide informational materials on rideshare programs such as iCommute San Diego.
- High-efficiency LED street and area lighting will be installed to achieve reduction in overall lighting energy.
- Increase new tree plantings throughout the neighborhood by planting two trees per dwelling unit which is equivalent to a minimum of 792 trees within the Project Site.

## **2.0 EXISTING ENVIRONMENTAL SETTING**

### **2.1 Existing Setting**

During the late 1800's, the ranch was owned by the Gird family and was used for farming and ranching of cattle. These activities survived into the 20th century, and the property was owned by a Hollywood couple as a gentleman farm into the 1940's. In modern times, the site has been in use as a stallion breeding farm for several decades, dating to the purchase of the property by the Vessels Family in 1981. The lower elevations of the property contain an equestrian facility which includes extensive pastures for horses, some of these areas have been cultivated in the past with row crops such as flowers or tomatoes though isn't considered an agricultural resource. Higher elevations and hillside areas were previously utilized for agriculture, with avocado cultivation being the dominant use in areas of steeper topography.

The only existing, operational use on-site is the existing equestrian facility. The existing equestrian use is roughly 375 acres and includes a horse stable, shade structures, employee homes, an equipment maintenance shop, and other ancillary buildings related to the equestrian use.

Land uses surrounding the Project mostly include single family residential to the south and east uses and a middle/high school facility to the southeast. Bonsall High School and Sullivan Middle School (located on the same site) are located about 140 meters, or about 600 feet, southeast of the closest residential lot. The property includes a variety of terrain, from relatively flat alluvial plain near the river along the northern boundary to ridges and hillsides near the property's southern boundaries. Elevations at the northern boundary vary from 175 feet above mean sea level (MSL) at the northwest, to 840 feet at the northeast. Elevations increase progressively to the south, with ridgelines at or near the southern boundary having elevations ranging from 367 feet at the southwest to 725 feet at the southeast.

### **2.2 Climate and Meteorology**

Climate within the San Diego Air Basin (SDAB) area often varies dramatically over short geographical distances with cooler temperatures on the western coast gradually warming to the east as prevailing winds from the west heat up. Most of southern California is dominated by high-pressure systems for much of the year, which keeps San Diego mostly sunny and warm. Typically, during the winter months, the high-pressure system drops to the south and brings cooler, moister weather from the north. It is common for inversion layers to develop within high-pressure areas, which mostly define pressure patterns over

the SDAB. These inversions are caused when a thin layer of the atmosphere increases in temperature with height. An inversion acts like a lid preventing vertical mixing of air through convective overturning. Meteorological trends within the Bonsall area generally show daytime highs ranging between 67°F in the winter to approximately 83°F in the summer with August usually being the hottest month. Daytime Low temperatures range from approximately 44°F in the winter to approximately 62°F in the summer. Precipitation is generally about 13 inches per year (WRCC, 2016). Prevailing wind patterns for the area vary during any given month during the year and also vary depending on the time of day or night. The predominant pattern though throughout the year is usually from the west or westerly (WRCC, 2018).

## 2.3 Regulatory Standards

### 2.3.1 Federal Standards and Definitions

The Federal Air Quality Standards were developed per the requirements of The Federal Clean Air Act, which is a federal law that was passed in 1970 and further amended in 1990. This law provides the basis for the national air pollution control effort. An important element of the act included the development of national ambient air quality standards (NAAQS) for major air pollutants.

The Clean Air Act established two types of air quality standards otherwise known as primary and secondary standards. **Primary Standards** set limits for the intention of protecting public health, which includes sensitive populations such as asthmatics, children and elderly. **Secondary Standards** set limits to protect public welfare to include the protection against decreased visibility, damage to animals, crops, vegetation and buildings. The EPA Office of Air Quality Planning and Standards (OAQPS) has set NAAQS for principal pollutants, which are called "criteria" pollutants. These pollutants are defined below:

1. **Carbon Monoxide (CO):** is a colorless, odorless, and tasteless gas and is produced from the partial combustion of carbon-containing compounds, notably in internal-combustion engines. Carbon monoxide usually forms when there is a reduced availability of oxygen present during the combustion process. Exposure to CO near the levels of the ambient air quality standards can lead to fatigue, headaches, confusion, and dizziness. CO interferes with the blood's ability to carry oxygen.
2. **Lead (Pb):** is a potent neurotoxin that accumulates in soft tissues and bone over time. The major sources of lead emissions have historically been motor vehicles (such as cars and trucks) and industrial sources. Because lead is only slowly excreted, exposures to small amounts of lead from a variety of sources can accumulate to harmful levels. Effects from inhalation of lead near the level of the ambient air quality standard include impaired blood formation and nerve conduction. Lead can adversely affect the nervous, reproductive, digestive, immune, and blood-forming systems. Symptoms can include fatigue, anxiety, short-term memory loss, depression, weakness in the extremities, and learning disabilities in children.
3. **Nitrogen Dioxide (NO<sub>2</sub>):** is a reactive, oxidizing gas capable of damaging cells lining the respiratory tract and is one of the nitrogen oxides emitted from high-temperature combustion, such as those occurring in trucks, cars, power plants, home heaters, and gas stoves. In the presence of other air

contaminants,  $\text{NO}_2$  is usually visible as a reddish-brown air layer over urban areas.  $\text{NO}_2$  along with other traffic-related pollutants is associated with respiratory symptoms, respiratory illness and respiratory impairment. Studies in animals have reported biochemical, structural, and cellular changes in the lung when exposed to  $\text{NO}_2$  above the level of the current state air quality standard. Clinical studies of human subjects suggest that  $\text{NO}_2$  exposure to levels near the current standard may worsen the effect of allergens in allergic asthmatics, especially in children.

4. **Particulate Matter ( $\text{PM}_{10}$  or  $\text{PM}_{2.5}$ ):** is a complex mixture of tiny particles that consists of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary in shape, size and chemical composition, and can be made up of multiple materials such as metal, soot, soil, and dust.  $\text{PM}_{10}$  particles are 10 microns ( $\mu\text{m}$ ) or less and  $\text{PM}_{2.5}$  particles are 2.5 ( $\mu\text{m}$ ) or less. These particles can contribute significantly to regional haze and reduction of visibility in California. Exposure to PM levels exceeding current air quality standards increases the risk of allergies such as asthma and respiratory illness.
5. **Ozone ( $\text{O}_3$ ):** is a highly oxidative unstable gas capable of damaging the linings of the respiratory tract. This pollutant forms in the atmosphere through reactions between chemicals directly emitted from vehicles, industrial plants, and many other sources. Exposure to ozone above ambient air quality standards can lead to human health effects such as lung inflammation, tissue damage and impaired lung functioning. Ozone can also damage materials such as rubber, fabrics and plastics.
6. **Sulfur Dioxide ( $\text{SO}_2$ ):** is a gaseous compound of sulfur and oxygen and is formed when sulfur-containing fuel is burned by mobile sources, such as locomotives, ships, and off-road diesel equipment.  $\text{SO}_2$  is also emitted from several industrial processes, such as petroleum refining and metal processing. Effects from  $\text{SO}_2$  exposures at levels near the one-hour standard include bronchoconstriction accompanied by symptoms, which may include wheezing, shortness of breath and chest tightness, especially during exercise or physical activity. Children, the elderly, and people with asthma, cardiovascular disease or chronic lung disease (such as bronchitis or emphysema) are most susceptible to these symptoms. Continued exposure at elevated levels of  $\text{SO}_2$  results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality.

### 2.3.2 State Standards and Definitions

CARB sets the laws and regulations for air quality on the state level. The California Ambient Air Quality Standards (CAAQS) is similar to the NAAQS and also restricts four additional contaminants. Table 2.1 on the following page identifies both the NAAQS and CAAQS. The additional contaminants as regulated by the CAAQS are defined below:

1. **Visibility Reducing Particles:** Particles in the Air that obstruct the visibility.
2. **Sulfates:** are salts of Sulfuric Acid. Sulfates occur as microscopic particles (aerosols) resulting from fossil fuel and biomass combustion. They increase the acidity of the atmosphere and form acid rain.
3. **Hydrogen Sulfide ( $\text{H}_2\text{S}$ ):** is a colorless, toxic and flammable gas with a recognizable smell of rotten eggs or flatulence.  $\text{H}_2\text{S}$  occurs naturally in crude petroleum, natural gas, volcanic gases, and hot springs. Usually,  $\text{H}_2\text{S}$  is formed from bacterial breakdown of organic matter. Exposure to low concentrations of hydrogen sulfide may cause irritation to the eyes, nose, or throat. It may also cause difficulty in breathing for some asthmatics. Brief exposures to high concentrations of hydrogen sulfide (greater than 500 Parts per Million (ppm)) can cause a loss of consciousness and possibly death.
4. **Vinyl Chloride:** also known as chloroethene and is a toxic, carcinogenic, colorless gas with a sweet odor. It is an industrial chemical mainly used to produce its polymer, polyvinyl chloride (PVC).

**Table 2.1: Ambient Air Quality Standards**

Ambient Air Quality Standards											
Pollutant	Average Time	California Standards <sup>1</sup>		Federal Standards <sup>2</sup>							
		Concentration <sup>3</sup>	Method <sup>4</sup>	Primary <sup>3,5</sup>	Secondary <sup>3,6</sup>	Method <sup>7</sup>					
Ozone ( $O_3$ ) <sup>8</sup>	1 Hour	0.09 ppm (180 $\mu g/m^3$ )	Ultraviolet Photometry	-	Same as Primary Standard	Ultraviolet Photometry					
	8 Hour	0.070 ppm (137 $\mu g/m^3$ )		0.070 ppm (137 $\mu g/m^3$ )							
Respirable Particulate Matter (PM10) <sup>9</sup>	24 Hour	50 $\mu g/m^3$	Gravimetric or Beta Attenuation	150 $\mu g/m^3$	Same as Primary Standard	Inertial Separation and Gravimetric Analysis					
	Annual Arithmetic Mean	20 $\mu g/m^3$		-							
Fine Particulate Matter (PM2.5) <sup>9</sup>	24 Hour	No Separate State Standard		35 $\mu g/m^3$	Same as Primary Standard	Inertial Separation and Gravimetric Analysis					
	Annual Arithmetic Mean	12 $\mu g/m^3$	Gravimetric or Beta Attenuation	12.0 $\mu g/m^3$							
Carbon Monoxide (CO)	8 hour	9.0 ppm (10mg/m <sub>3</sub> )	Non-Dispersive Infrared Photometry (NDIR)	9 ppm (10 mg/m <sub>3</sub> )	-	Non-Dispersive Infrared Photometry					
	1 hour	20 ppm (23 mg/m <sub>3</sub> )		35 ppm (40 mg/m <sub>3</sub> )							
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m <sub>3</sub> )		-							
Nitrogen Dioxide (NO <sub>2</sub> ) <sup>10</sup>	Annual Arithmetic Mean	0.030 ppm (57 $\mu g/m^3$ )	Gas Phase Chemiluminescence	0.053 ppm (100 $\mu g/m^3$ ) <sup>8</sup>	Same as Primary Standard	Gas Phase Chemiluminescence					
	1 Hour	0.18 ppm (339 $\mu g/m^3$ )		0.100 ppm <sup>8</sup> (188/ $\mu g/m^3$ )							
Sulfur Dioxide (SO <sub>2</sub> ) <sup>11</sup>	Annual Arithmetic Mean	-	Ultraviolet Fluorescence	0.030 ppm <sup>10</sup> (for Certain Areas)	-	Ultraviolet Fluorescence; Spectrophotometry (Pararoosaniline Method) <sup>9</sup>					
	24 Hour	0.04 ppm (105 $\mu g/m^3$ )		0.14 ppm <sup>10</sup> (for Certain Areas) (See Footnote 9)							
	3 Hour	-		-							
	1 Hour	0.25 ppm (655 $\mu g/m^3$ )		0.5 ppm (1300 $\mu g/m^3$ )							
Lead <sup>12,13</sup>	30 Day Average	1.5 $\mu g/m^3$	Atomic Absorption	-	Same as Primary Standard	High Volume Sampler and Atomic Absorption					
	Calendar Quarter	-		1.5 $\mu g/m^3$							
	Rolling 3-Month Average	-		0.15 $\mu g/m^3$							
Visibility Reducing Particles	8 Hour	See footnote 14									
Sulfates	24 Hour	25 $\mu g/m^3$	Ion Chromatography								
Hydrogen Sulfide	1 Hour	0.03 ppm (42 $\mu g/m^3$ )	Ultraviolet Fluorescence								
Vinyl Chloride <sup>12</sup>	24 Hour	0.01 ppm (26 $\mu g/m^3$ )	Gas Chromatography								
1.	California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.										
2.	National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For PM2.5, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.										
3.	Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.										
4.	Any equivalent procedure which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.										
5.	National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.										
6.	National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.										
7.	Reference method as described by the EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the EPA.										
8.	On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.										
9.	On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 $\mu g/m^3$ to 12.0 $\mu g/m^3$ . The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 $\mu g/m^3$ , as was the annual secondary standard of 15 $\mu g/m^3$ . The existing 24-hour PM10 standards (primary and secondary) of 150 $\mu g/m^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.										
10.	To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.										
11.	On June 2, 2010, a new 1-hour SO2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.										
12.	The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.										
13.	The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.										
14.	In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

### 2.3.3 Regional Standards

The State of California has 35 specific air districts, which are each responsible for ensuring that the criteria pollutants are below the NAAQS and CAAQS. Air basins that exceed either the NAAQS or the CAAQS for any criteria pollutants are designated as "non-attainment areas" for that pollutant. Currently, there are 15 non-attainment areas for the federal ozone standard and two non-attainment areas for the PM<sub>2.5</sub> standard and many areas are in non-attainment for PM<sub>10</sub> as well. California therefore created the California State Implementation Plan (SIP), which is designed to provide control measures needed to attain ambient air quality standards.

The San Diego Air Pollution Control District (SDAPCD) is the government agency which regulates sources of air pollution within County. Therefore, the SDAPCD developed a Regional Air Quality Strategy (RAQS) to provide control measures to try to achieve attainment status for state ozone standards with control measures focused on Volatile Organic Compounds (VOCs) and oxides of nitrogen (NO<sub>x</sub>). Currently, San Diego is in "non-attainment" status for federal and state O<sub>3</sub> and State PM<sub>10</sub> and PM<sub>2.5</sub>. An attainment plan is available for O<sub>3</sub>. The RAQS was adopted in 1992 and has been updated as recently as 2016 which was the latest update incorporating minor changes to the prior 2009 update.

The 2016 update mostly summarizes how the 2009 update has lowered NO<sub>x</sub> and VOCs emissions which reduces ozone and clarifies and enhances emission reductions by introducing for discussion three new VOC and four new NO<sub>x</sub> reduction measures. NO<sub>x</sub> and VOCs are precursors to the formation of ozone in the atmosphere. The criteria pollutant standards are generally attained when each monitor within the region has had no exceedances during the previous three calendar years. A complete listing of the current attainment status for criteria pollutants with respect to both federal and state nonattainment status by pollutants for County is shown in Table 2.2 on the following page (SDAPCD, 2018).

The RAQS is largely based on population predictions by the San Diego Association of Governments (SANDAG). Projects that produce less growth than predicted by SANDAG would generally conform to the RAQS. Projects that create more growth than projected by SANDAG may create a significant impact if the project produces unmitigable air quality emissions or if the project produces cumulative impacts.

**Table 2.2: San Diego County Air Basin Attainment Status by Pollutant**

Criteria Pollutant	Federal Designation	State Designation
Ozone (8-Hour)	Nonattainment	Nonattainment
Ozone (1-Hour)	Attainment *	Nonattainment
Carbon Monoxide	Attainment	Attainment
PM10	Unclassifiable **	Nonattainment
PM2.5	Attainment	Nonattainment
Nitrogen Dioxide	Attainment	Attainment
Sulfur Dioxide	Attainment	Attainment
Lead	Attainment	Attainment
Sulfates	No Federal Standard	Attainment
Hydrogen Sulfide	No Federal Standard	Unclassified
Visibility	No Federal Standard	Unclassified

\* The federal 1-hour standard of 12 ppmm was in effect from 1979 through June 15, 2005. The revoked standard is referenced here because it was employed for such a long period and because this benchmark is addressed in State Implementation Plans.

\*\* At the time of designation, if the available data does not support a designation of attainment or nonattainment, the area is designated as unclassifiable.

(SDAPCD, 2018)

## 2.4 California Environmental Quality Act (CEQA) Significance Thresholds

The California Environmental Quality Act has provided a checklist to identify the significance of air quality impacts. These guidelines are found in Appendix G of the CEQA guidelines and are as follows:

AIR QUALITY -- Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the Project:

- A: Conflict with or obstruct implementation of the San Diego RAQS or applicable portions of the SIP?
- B: Result in emissions that would violate any air quality standard or contribute substantially to an existing or projected air quality violation?
- C: Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable Federal or State ambient air quality standard (PM10, PM2.5 or exceed quantitative thresholds for O3 precursors, NOX and VOCs)?
- D: Expose sensitive receptors (including, but not limited to, schools, hospitals, resident care facilities, residential uses or day-care centers) to substantial pollutant concentrations?
- E: Create objectionable odors affecting a substantial number of people?

## 2.5 SDAPCD Rule 20.2 – Air Quality Impact Assessment Screening Thresholds

The SDAPCD has established thresholds in Rule 20.2 for new or modified stationary sources. The County's Guidelines for Determining Significance and Report Format and Content Requirements incorporate screening level thresholds from Rule 20.2 for use in all County related Air Quality Impact Assessments (AQIA) and for determining CEQA air quality impacts (County of San Diego, 2007). These screening criteria can be used to demonstrate that a project's total emissions would not result in a significant impact as defined by CEQA. Also, since SDAPCD does not have air quality impact threshold for VOCs, it is acceptable to use the Coachella Valley VOC threshold from South Coast Air Quality Management District. Should emissions be found to exceed these thresholds, additional modeling is required to demonstrate that the project's total air quality impacts are below the state and federal ambient air quality standards. These screening thresholds for construction and daily operations are shown in Table 2.3 on the following page.

Non Criteria pollutants such as Hazardous Air Pollutants (HAPs) or Toxic Air Contaminants (TACs) are also regulated by the SDAPCD. Rule 1200 (Toxic Air Contaminants - New Source Review) adopted on June 12, 1996, requires evaluation of potential health risks for any new, relocated, or modified emission unit which may increase emissions of one or more toxic air contaminants. The rule requires that projects that propose to increase cancer risk to between 1 and 10 in one million need to implement toxics best available control technology (T-BACT) or impose the most effective emission limitation, emission control device or control technique to reduce the cancer risk. At no time shall the project increase the incremental cancer risk to over 10 in one million or a health hazard index (chronic and acute) greater than one. Projects creating cancer risks less than one in one million are not required to implement T-BACT technology.

The U.S. EPA uses the term VOC and the CARB's Emission Inventory Branch (EIB) uses the term Reactive Organic Gases (ROG) to essentially define the same thing. There are minor deviations between compounds that define each term however for purposes of this study we will assume they are essentially the same due to the fact SCAQMD interchanges these words and because Air Quality models directly calculates ROG in place of VOC.

**Table 2.3: Screening Level Thresholds for Criteria Pollutants**

Pollutant	Total Emissions (Pounds per Day)
Construction Emissions	
Respirable Particulate Matter (PM <sub>10</sub> and PM <sub>2.5</sub> )	100 and 55
Nitrogen Oxide (NO <sub>x</sub> )	250
Sulfur Oxide (SO <sub>x</sub> )	250
Carbon Monoxide (CO)	550
Volatile Organic Compounds (VOCs)	75
Reactive Organic Gases (ROG) SCAQMD	75
Operational Emissions	
Respirable Particulate Matter (PM <sub>10</sub> and PM <sub>2.5</sub> )	100 and 55
Nitrogen Oxide (NO <sub>x</sub> )	250
Sulfur Oxide (SO <sub>x</sub> )	250
Carbon Monoxide (CO)	550
Lead and Lead Compounds	3.2
Volatile Organic Compounds (VOCs)	75
Reactive Organic Gases (ROG) SCAQMD	75

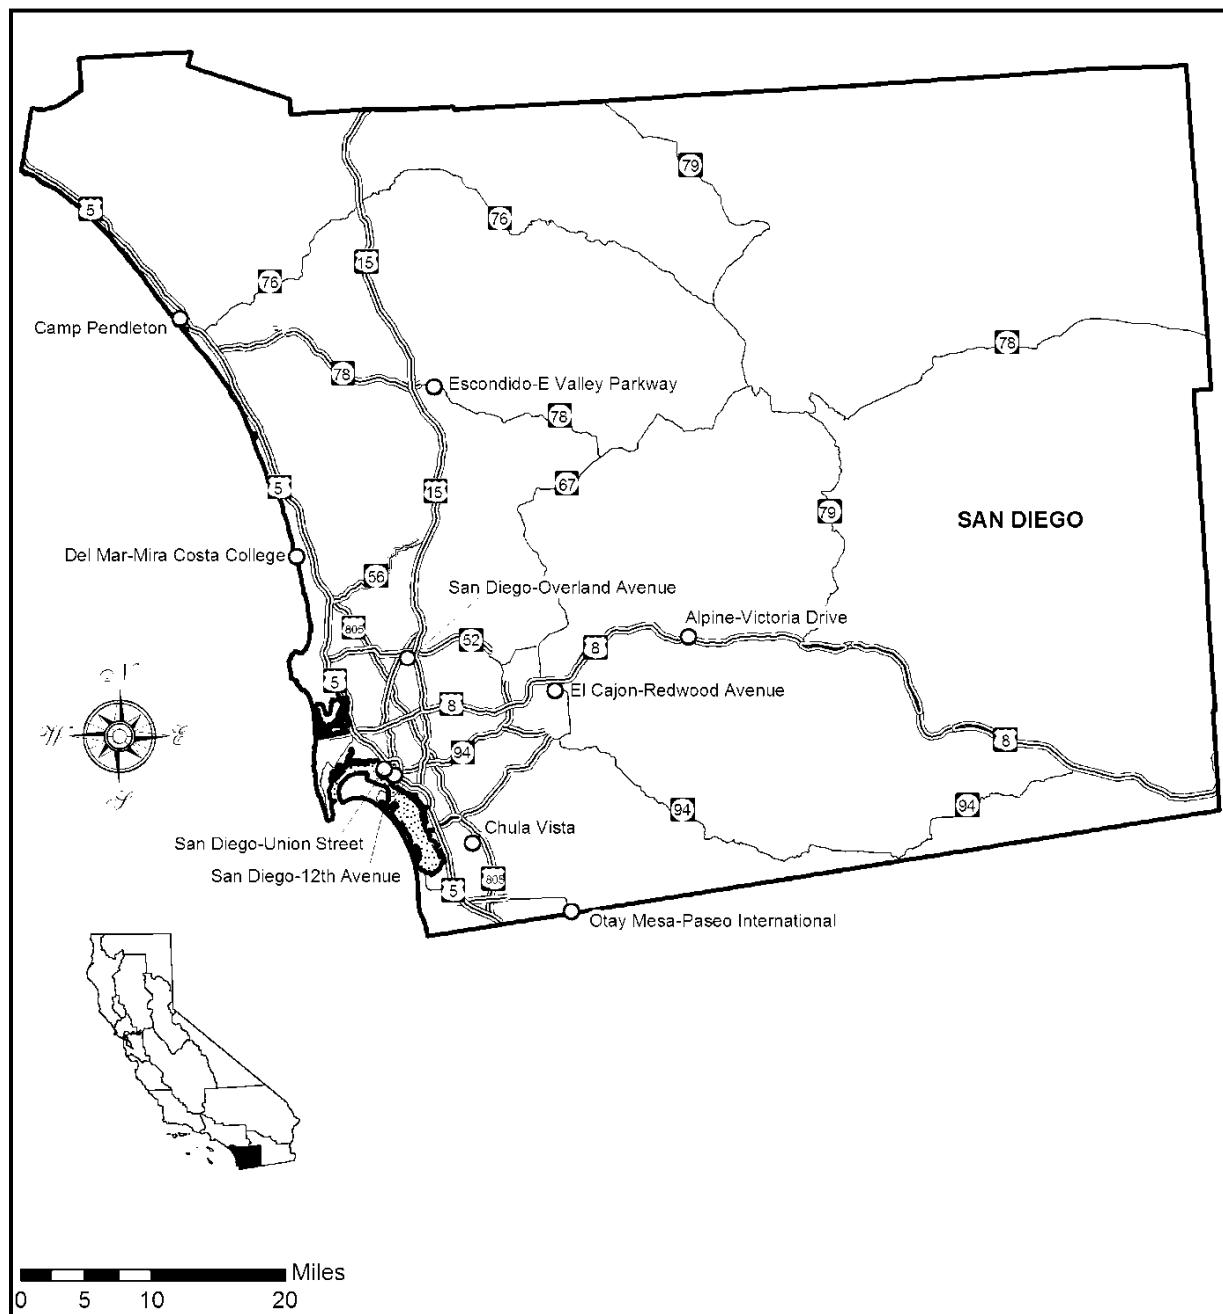

## 2.6 Local Air Quality

Criteria pollutants are measured continuously throughout the San Diego Air Basin. This data is used to track ambient air quality patterns throughout the County. As mentioned earlier, this data is also used to determine attainment status when compared to the NAAQS and CAAQS. The SDAPCD is responsible for monitoring and reporting monitoring data (SDAPCD, 2018). SDAPCD operates monitoring sites, which collect data on criteria pollutants. The closest monitoring locations to the project site is the Escondido monitoring location roughly 14 miles to the south-southeast, and the Camp Pendleton monitoring station. Table 2.4 on the following page identifies the criteria pollutants monitored at the aforementioned stations.

**Table 2.4: Three-Year Ambient Air Quality Summary near the Project Site**

Pollutant	Closest Recorded Ambient Monitoring Site	Averaging Time	CAAQS	NAAQS	2015	2016	2017	Days Exceeded over 3 years	
O <sup>3</sup> (ppm)	Camp Pendleton or Escondido Monitoring Station	1 Hour	0.09 ppm	No Standard	0.09	0.08	0.09	0	
		8 Hour	0.070 ppm	0.070 ppm	0.08	0.07	0.08	10	
		24 Hour	50 µg/m <sup>3</sup>	150 µg/m <sup>3</sup>	30	-	-	N/A	
		Annual Arithmetic Mean	20 µg/m <sup>3</sup>	No Standard	19.4	-	-	N/A	
		24 Hour	No Standard	35 µg/m <sup>3</sup>	29.4	-	-	N/A	
		Annual Arithmetic Mean	12 µg/m <sup>3</sup>	15 µg/m <sup>3</sup>	8.6	-	-	N/A	
		Annual Arithmetic Mean	0.030 ppm	0.053 ppm	0.006	0.006	0.006	N/A	
		1 Hour	0.18 ppm	0.100 ppm	0.060	0.072	0.063	N/A	
		1 Hour	20 ppm	35 ppm	3.1	-	-	N/A	
		8 Hour	9 ppm	9 ppm	2.0	-	-	N/A	
Notes:									
- Yearly maximums marked with "-" indicated data was not available for either monitoring station.									
Days exceeded marked with "N/A" indicate no data available									
* Data was selected from the closest Escondido Location									

**Figure 2-A: Ambient Air Quality Monitoring Stations within SDAB – CARB**

### **3.0 METHODOLOGY**

#### 3.1 Construction Emissions Calculations

Air Quality impacts related to construction and daily operations were calculated using the latest CalEEMod 2016.3.2 air quality model, which was developed by BREEZE Software for South Coast Air Quality Management District (SCAQMD) in 2017. The construction module in CalEEMod is used to calculate the emissions associated with the construction of the Project and uses methodologies presented in the US EPA AP-42 document with emphasis on Chapter 11.9. The CalEEMod input/output model is shown in **Attachment A** to this report.

The SCREEN3 dispersion model will be used to determine the concentration for air pollutants at any location near the pollutant generator. Additionally, the model will predict the point of maximum exposure from the project site and maximum concentrations. The notable toxic air contaminant from construction is diesel exhaust since exposure to diesel exhaust is known to cause cancer and acute and chronic health effects to sensitive residential receptors which are located between 140 and 300 meters from the project. Diesel exhaust emissions can be estimated using the annual PM<sub>10</sub> exhaust emissions from onsite construction operations obtained from the annual CalEEMod model output by summing each onsite source for the construction duration. The SCREEN3 input/output file for the proposed Project is shown in **Attachment B** at the end of this report.

Once the dispersed concentrations of diesel particulates are estimated in the surrounding air, they are used to evaluate estimated exposure to people. Exposure is evaluated by calculating the dose in milligrams per kilogram body weight per day (mg/kg/d). For residential exposure, the breathing rates are determined for specific age groups, so inhalation dose (Dose-air) is calculated for each of these age groups, 3rd trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years. The following algorithms calculate this dose for exposure through the inhalation pathways. The worst case cancer risk dose calculation is defined in Equation 1 below (OEHHA, February 2015):

*Equation 1*

$$Dose_{air} = C_{air} * (BR/BW) * A * EF * (1 \times 10^{-6})$$

Dose <sub>air</sub>	=	Dose through inhalation (mg/kg/d) Concentration in air ( $\mu\text{g}/\text{m}^3$ ) Annual average Diesel Particulate Matter (DPM)
C <sub>air</sub>	=	concentration in $\mu\text{g}/\text{m}^3$ -SCREEN3 predicts a 1-hr concentration and is corrected to an annual average by multiplying the 1-hr average by 0.08 (US EPA, 1992)
BR/BW	=	Daily breathing rate normalized to body weight (L/kg BW-day). See Table I.2 for the daily breathing rate for each age range.
A	=	Inhalation absorption factor (assumed to be 1)
EF	=	Exposure frequency (unitless, days/365 days)
$1 \times 10^{-6}$	=	Milligrams to micrograms conversion ( $10^{-3}$ mg/ $\mu\text{g}$ ), cubic meters to liters conversion ( $10^{-3}$ $\text{m}^3/\text{l}$ )

Cancer risk is calculated by multiplying the daily inhalation or oral dose, by a cancer potency factor, the age sensitivity factor, the frequency of time spent at a person's home or exposed to the risk and the exposure duration divided by averaging time, to yield the excess cancer risk. As described below, the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk for any given location. Specific factors as modeled are shown within the project models attached to this report. The worst case cancer risk calculation is defined in Equation 2 below (OEHHA, February 2015):

*Equation 2*

$$\text{RISK}_{\text{inh-res}} = \text{DOSE}_{\text{air}} \times \text{CPF} \times \text{ASF} \times \text{ED/AT} \times \text{FAH}$$

RISK <sub>inh-res</sub>	=	Residential inhalation cancer risk
DOSE <sub>air</sub>	=	Daily inhalation dose (mg/kg-day)
CPF	=	Inhalation cancer potency factor (mg/kg-day) <sup>-1</sup>
ASF	=	Age sensitivity factor for a specified age group (unitless)
ED	=	Exposure duration (in years) for a specified age group
AT	=	Averaging time for lifetime cancer risk (years)
FAH	=	Fraction of time spent at home or exposed to the risk (unitless)

OEHHA recommends that an exposure duration (residency time) of 30 years be used to estimate individual cancer risk for the Maximally Exposed Individual Resident (MEIR). OEHHA also recommends that the 30-year exposure duration be used as the basis for public notification and risk reduction audits and plans.

Exposure durations of 9-years and 70-years are also recommended to be evaluated for the MEIR to show the range of cancer risk based on residency periods. If a facility is notifying the public regarding cancer risk, the 9-and 70-year cancer risk estimates are useful for people who have resided in their current residence for periods shorter and longer than 30 years. Health risk calculations are shown in **Attachment C** to this report.

Non-Cancer risks or risks defined as chronic or acute are also known with respect to DPM and are determined by the hazard index. To calculate hazard index, DPM concentration is divided by its chronic Reference Exposure Levels (REL). Where the total equals or exceeds one, a health hazard is presumed to exist. RELs are published by the Office of Environmental Health Hazard Assessment (OEHHA, February 2015). Diesel Exhaust has a REL of 5 µg/m<sup>3</sup> and targets the respiratory system.

### 3.2 Construction Assumptions

The Project construction dates were estimated based on a construction kickoff in 2022 with construction ending in 2029. The proposed project calls for the demolition of up to 15,000 SF of structures. The project would then grade the site to allow for construction of the single-family homes. Once earthwork activities are completed, paving and building construction activities would follow.

CalEEMod 2016.3.2 was utilized for all calculations and included manual updates to the model to reflect the usage of SDAPCD Rule 67 paint VOC limits as well as design features to use Tier 3 or better ratings with DPF for all diesel equipment used during grading and construction. Additionally, per the project engineer, approximately 1,900,000 CY of balanced cut / fill of which 945,000 Cubic Yards of that same material will be hauled onsite 1,500 feet away within Planning Areas 1 and 2. For purposes of analysis, a haul distance of 0.5 miles was assumed. Additionally, the project engineer indicated that up to 32 acres of paving will be required which was included within the modeling. Table 3.1 on the following page shows the Project Engineer expected timeframes for construction processes for all the project infrastructure, facilities and improvements at the proposed project location, as well as the expected number of pieces of equipment. Whenever defaults were not used, the model was updated manually.

It should also be noted that the project design engineer expects that up to three separate blasts will be required during grading. During blasting operations, grading operations would temporarily stop and resume once blasting is completed. Per conversations with the project Civil Engineer, it is expected that each blast, limited to once a day, would be limited to six tons Ammonium Nitrate for any given blast operation. The area of each blast would be limited to 20,000 SF or (100-foot x 200-foot) area.

Blasting operations usually require a chemical material that is capable of extremely rapid combustion resulting in an explosion or detonation. These materials are usually mixtures of several ingredients but are often oxygen deficient as combustion reactions take place which causes a formation of carbon monoxide and to a lesser extent, nitrogen oxides. For ammonium nitrate and fuel oil (ANFO) mixtures it is expected that carbon monoxide would be generated in quantities of 67 lbs per every ton of explosives and nitrogen oxides would be generated at 17 lbs per the same quantity (EPA, 1995). Particulate matter will also be generated from blasting and can be estimated using Table 11.9-1 of the aforementioned document (EPA, 1995) using the following equation:

$$PM_{10} (lb / Blast) = 0.000014 * (BlastArea(ft^2)) * 0.52$$

**Table 3.1: Expected Construction Equipment**

Equipment Identification	Proposed Start	Proposed Complete	Quantity
<b>Demolition</b>	03/01/2022	03/21/2022	
Excavators			1
<b>Site Preparation</b>	03/22/2022	07/25/2022	
Rubber Tired Dozers			3

Welders			1
<b>Architectural Coating</b>	5/20/2024	07/5/2029	
Air Compressors			1
This equipment list is based upon equipment inventory within CalEEMod. The quantity and types are based upon assumptions from Projects of similar size and scope in the County of San Diego.			

### 3.3 Operational Emissions

Once construction is completed the proposed project would generate emissions from daily operations which would include sources such as Area, Energy, Waste and Water uses, which are also calculated within CalEEMod. Area Sources include consumer products, landscaping and architectural coatings as part of regular maintenance. Energy sources would be from uses such as onsite natural gas use. Additionally, it was assumed that an average of 10% of the structural surface area will be re-painted each year.

Finally, the project would also generate emissions through the use of vehicles for transportation. The Project was estimated to generate 3,990 Average Daily Trips (ADT) as identified within the Project traffic study (LSA, 2019). These daily trips were utilized within

the CalEEMod analysis using a rural setting. The Operational model are also shown in **Attachment A** at the end of this report.

### 3.4 Micro Scale Operational Emissions

Air pollutant emissions related to Project traffic have the potential to create new, or worsen existing localized air quality violations with respect to carbon monoxide (CO). These increased carbon monoxide "Hot Spots" are determined through the utilization of the Institute of Transportation Studies (ITS) Transportation Project-Level Carbon Monoxide Protocol (University of California, Davis, 1997).

In the event the proposed project traffic adds vehicular trips to either an intersection that operates at Level of Service (LOS) E or F or the addition project trips re-classify the intersection from an acceptable LOS to LOS E or F, and when total intersection peak-hour trips exceed 3,000 vehicles, the Project must conduct a CO "Hot Spot" analysis (County of San Diego, 2007).

The ITS Transportation Project-Level Carbon Monoxide Protocol recommends running the EMFAC model to determine emission rates for the Project year as well as conduct dispersion modeling utilizing CALINE to determine worst-case emission concentrations. The EMFAC model is provided as **Attachment D** to this report.

The Project traffic study reported that the proposed Project combined with existing traffic would add trips to seven intersections having LOS of E or worse. However only three of these intersections would have more than 3,000 vehicles per hour. These intersections as identified within the project traffic study are shown in Table 3.2 (LSA, 2019). It should be noted that the project traffic study indicated that impacts combined with cumulative impacts would be fully mitigated through signalization and traffic impact fees.

**Table 3.2: Intersections LOS E or Worse and Delay**

Intersection	Peak Hour	Number of peak-hour Vehicles	LOS	Delay	Project Added Peak-Hour Vehicles
Highway 76 / Olive Hill Road/Camino Del Rey	AM	4,733	E	57.9	80
	PM	5074	E	56.7	100
Old Highway 395 / SR-76	AM	3274	F	69.8	72
	PM	3215	D	31.0	88
SR-76 / Old River Road - East Vista Way	AM	4193	D	52.7	61
	PM	4635	F	138.5	76

Micro-Scale operations during these conditions show that the Project would add trips to these intersections and would have a potential generate CO emissions in excess of the CAAQS. For purposes of this analysis, the CAAQS would be considered the most stringent air quality standard with CO limits of 9 parts per million (PPM) for the one-hour standard and 20 PPM CO for the 8-hour standard and are used within this analysis. Additionally, the CALINE model incorporated the highest 8-hour and 1-hour air quality data as collected at the Escondido monitoring station, which in 2014 was 3.1 PPM and 3.8 PPM, respectively. The CALINE models are shown in **Attachment E** to this report.

### 3.5 Odor Impacts (Onsite)

Potential onsite odor generators would include short-term construction odors from activities such as paving and possibly painting. Odors created during short-term construction activities would most likely be from placing asphalt which has a slight odor from the bitumen and solvents used within hot asphalt and architectural coating. Asphalt operations are fairly quick and would cause less than significant impacts.

The proposed project will be constructed on a site which has existing equestrian activities which will remain. The proposed project would not result in any increase in activities related to the equestrian use and would therefore not increase odors generated by the equestrian use. Given this, these equestrian activities will generate equestrian odors which cannot be avoided. Each residential unit sold within the project site will require full disclosure in perpetuity of any equestrian activities within the project site. Based on this, the project would have less than significant impacts. Further discussion of onsite odor impacts is not included in this report.

## **4.0 FINDINGS**

### **4.1 Construction Findings**

Construction emissions in pounds per day from the construction operations and equipment identified in Section 3.2 is shown in Tables 4.1 and 4.2 for summer and winter timeframes respectively. The grading operations are expected to take up to nine months with blasting to occur on an occasional basis. During blasting operations, grading operations would stop and it's expected that each blast operation would require between 10,000 - 12,000 lbs of Ammonium Nitrate. As a design feature, the proposed project would utilize no more than 6 tons of ammonium nitrate daily which would generate up to 402 lbs (67 lbs/ton \* 6 tons) of carbon monoxide and up to 102 lbs (17 lbs/ton \* 6 tons) of nitrogen oxides during a blast utilizing 6 tons of ammonium nitrate. These quantities would be additive to the mass grading operations for the entire project site and could be added to the worst-case mass grading daily CO and NO<sub>x</sub> output. Additional particulates derived from each blast is estimated over a 20,000 SF area roughly 100-foot by 200-foot in dimension as identified in Section 3.2. Given this, it's estimated that each blast would generate 20.59 lb/blast as is shown in the equation below:

$$PM_{10} (lb / Blast) = 0.000014 * (20,000 ft^2)^{1.5} * 0.52 = 20.59(lb / blast)$$

**Table 4.1: Expected Construction Emissions Summary – Pounds per Day (Summer)**

Year	ROG	NO <sub>x</sub>	CO	SO <sub>2</sub>	PM <sub>10</sub> (Dust)	PM <sub>10</sub> (Exhaust)	PM <sub>10</sub> (Total)	PM <sub>2.5</sub> (Dust)	PM <sub>2.5</sub> (Exhaust)	PM <sub>2.5</sub> (Total)
2022	4.161	96.392	86.203	0.183	37.110	0.447	37.272	12.067	0.446	12.228

Blasting Emissions calculations in text above		102	402		20.59		20.59			
Construction w/ Blasting (Maximum)	13.993	197.416	489.34	0.232	57.7	0.452	57.867	12.067	0.45	12.233
<b>Significance Threshold (lb/day)</b>	<b>75</b>	<b>250</b>	<b>550</b>	<b>250</b>	-	-	<b>100</b>	-	-	<b>55</b>
<b>SDAPCD Impact?</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>	-	-	<b>No</b>	-	-	<b>No</b>

Based on these numbers, the project would not exceed County screening level thresholds and would not require mitigation to comply. It should be noted that as a design feature, the project construction team will utilize Tier 3 or better construction diesel equipment with DPF for this project.

## 4.2 Health Risk

The nearest sensitive receptors are between 140 and 300 meters away from the project grading boundaries to include the nearby school and residences to the south of the project. The proposed project will be mandated to utilize required Tier 3 construction equipment with DPF attached. Based upon the annual air quality modeling outputs, worst-case PM<sub>10</sub> generated from onsite construction exhaust would cumulatively produce 0.121 tons over the construction duration 2,768-calendar days or an average of 0.00046 grams/second. The average emission rate over the grading area is 3.63x10<sup>-10</sup> g/m<sup>2</sup>/s, which was calculated as follows:

$$\frac{0.00046 \frac{\text{grams}}{\text{second}}}{312 \text{ acres} * 4,046 \frac{\text{meters}^2}{\text{acre}}} = 3.63 * 10^{-10} \frac{\text{grams}}{\text{meters}^2 \text{ second}}$$

Utilizing the SCREEN3 dispersion model, we find that the peak maximum 1-hr concentration is 0.045  $\mu\text{g}/\text{m}^3$  during the worst-case construction period. Converting the peak 1-hr concentration to an annual concentration reduces the concentration to 0.0036  $\mu\text{g}/\text{m}^3$ . Therefore, utilizing the risk equation identified above in Section 3.1, the inhalation cancer risk for the point of maximum exposure (800 meters from the project boundary) is 4.61 per one million exposed which does not exceed 10 per one million exposed. Based on this, since the project will be required to utilize Tier 3 equipment with DPF or better, no health risks related to diesel equipment during construction would be expected.

The nearest sensitive receptors are between 140 and 300 meters away from the project grading boundaries include the nearby school and residences to the south of the project. They would be exposed to a cancer risk of no greater than 4.61 per one million exposed. Given this, a less than significant impact would be expected at these units. It should be noted that at least Tier 3 equipment with DPF will be required and is considered T-BACT. There are known acute and chronic health risks associated with diesel exhaust which are considered non-cancer risks. These risks are calculated based on methods identified in Section 3.1. From this we find that the annual concentration of 0.0036  $\mu\text{g}/\text{m}^3$  divided by the REL of 5  $\mu\text{g}/\text{m}^3$  yields a Health Hazard Index of 0.0007, which is less than one. Therefore, no non-cancer risks are expected and all health risks are considered less than significant.

#### 4.3 Operational Findings

The project traffic generation from the project traffic study was utilized within CalEEMod 2016.3.2 (LSA, 2019). Additionally, the model was run for the winter and summer scenarios to determine operational impacts for the buildout year of full operations. The expected daily pollutant generation can be calculated utilizing the product of the average daily miles traveled and the expected emissions inventory calculated by EMFAC2014; CALEEMOD 2016.3.2 performs this calculation. The daily pollutants calculated for summer and winter are shown in Tables 4.3 and 4.4.

**Table 4.3: Expected Summer Daily Pollutant Generation**

Daily pollutant generation assumes trip distances within CalEEMod  
The final numbers are all rounded within Excel and are reported as rounded numbers.

Based upon these calculations, the proposed project would not exceed SDAPCD operational air quality significance thresholds and would not be required to implement specific mitigation measures to comply with CEQA and SDAPCD thresholds. It should be noted however that PDFs identified in Section 1.4 of this report will be conditions of approval by the County.

#### 4.4 Micro-Scale Operational Findings

The Project traffic study reported that the proposed Project would add project related traffic to three intersections operating at LOS E or worse and having more than 3,000 peak hour vehicles. Based on review of the data in Table 3.2 above, the worst-case intersection or the intersection having the most combined trips is the intersection of *Highway 76 / Olive Hill Road/Camino Del Rey* with over 5,074 vehicles during the PM peak-hour of which 80 are project related. It should be noted that the proposed project would add a larger number of project specific trips to other intersections however, these intersections would have fewer than 3,000 peak hour trips and would therefore have less than significant impacts.

The CALINE4 model was set up to show a typical intersection with a North, East, South and West segment extending a typical 50-meters in every direction. Peak-Hour volumes were taken from the peak-hour turning movements within the project traffic study (LSA, 2019) for the worst-case intersection identified. Sensitive receptors were assumed to be roughly 25-feet to each roadway which represents a worst-case environment. The EMFAC2014 model was run to determine the emission factors for 2025 since its expected vehicles will be added to the roadways by 2025 and this calculation is conservative since using a 2030 scenario (first buildout year expected) in EMFAC would have lower emission factors. Based on this analysis for the worst case intersection having the highest number of peak hour vehicles and the highest number of project added vehicles would produce less than significant CO impacts. Furthermore, since all other intersections have less than 3,000 total

peak hour vehicles, a less than significant CO impact at these locations would also be expected.

Table 4.5 identifies both the 1-hour emission concentration predictions and the 8-hour average after utilizing the carbon dioxide persistence factor of 0.7. Based on model output results, the CO impacts at this intersection would be less than significant. Based on this calculation, since all other remaining intersections have lower traffic volumes, we can conclude that all other remaining intersections would also comply with the CAAQS.

**Table 4.5: Expected Carbon Monoxide Hot Spot Concentration Levels**

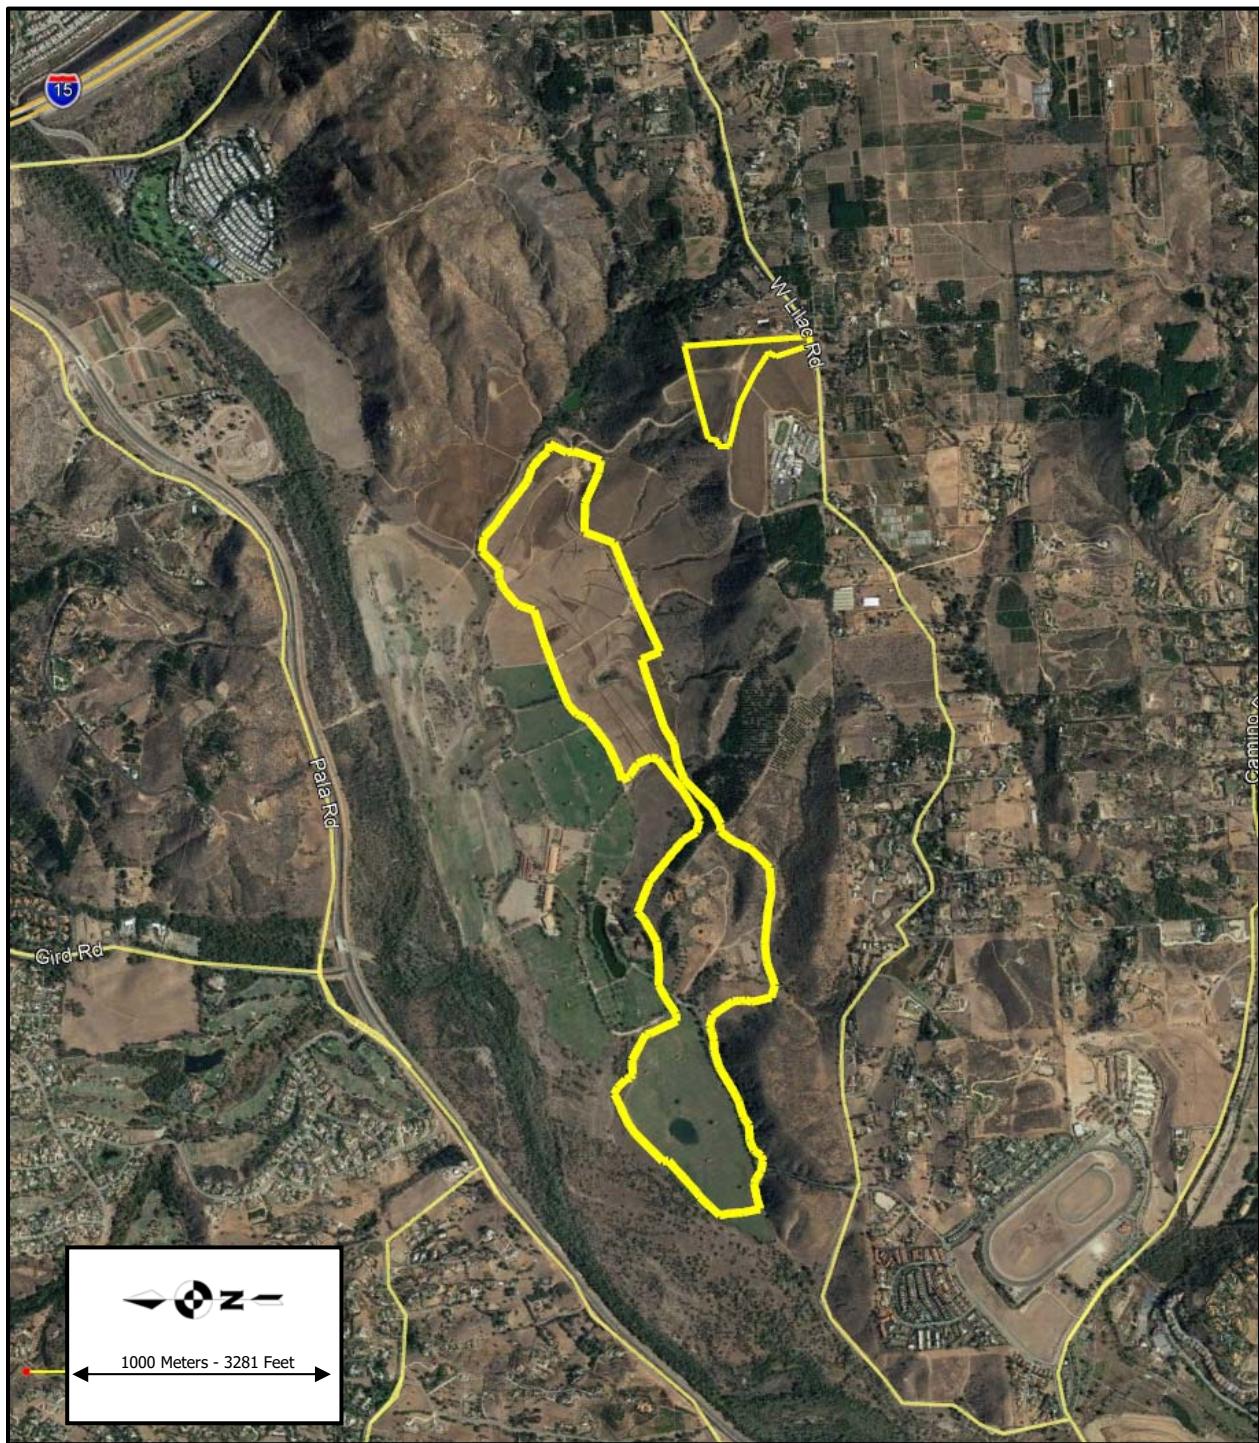

Intersection	Vehicles Per Hour	Predicted Concentration PPM	
	PM	1 HR	8HR
Highway 76 / Olive Hill Road/Camino Del Rey	5,074	3.3	2.31
CAAQS - Significant Thresholds?		20	9
<b>Significant</b>		<b>No</b>	<b>No</b>
Emission levels taken from EMFAC 2014 Traffic Volumes obtained from Project Traffic Study (LSA, 2019)			

#### 4.5 Cumulative Impact Findings

Cumulative impacts would exist when either there are direct air quality impacts or when multiple construction projects occur within the same area simultaneously. To illustrate this, if a project was to produce air quality emissions simultaneous to a nearby construction project the addition of both project emissions to the environment could exceed significance thresholds. If a nearby project was to be under construction at the same time, that project would need to produce an additive amount of emissions close to the project site such that emissions would exceed thresholds. In Section 4.2, it was found the maximum exposure for dispersed emissions would be roughly 800 meters from the project construction boundary.

As can be seen in Figure 4-A on the following page, the proposed project residential construction areas are located within a 1,402.52-acre site and large buffer areas exist between construction areas (identified in yellow) and off project sites or developable areas adjacent to the project site for which cumulative projects could be proposed. The nearest large project at this time with a potential to cumulatively increase construction emissions would be the Lilac Hills Ranch, roughly 3,000 meters to the southeast which is well beyond the 800-meter point of maximum exposure predicted by air dispersion modeling.

**Figure 4-A: Proposed Residential Construction Areas**

Additionally, it should be noted that any potential cumulative projects would be separated by intervening topography and a freeway. Since the separation distances exceeds more than 3,000 meters or 2,200 meters from the point of maximum exposure in combination with intervening topography, the project would have a less than significant cumulative construction impact.

The Project property has multiple zoning and land use designations and the proposed project would be consistent with overall densities allowed by the General Plan for the site. The Project seeks a major use permit for the residential uses and one for the equestrian uses which will formalize the operational requirements for each set of uses. The Project's overall buildout of 396 units would be consistent with the existing General Plan Land Use Designations allowing up to 402 units. Additionally, the Project would be consistent with existing zoning designations of A70 (Limited Agricultural Use), S80 (Open Space), and RV (Variable Family Residential), to include all applicable Special Area Regulations, and Animal Regulations (County of San Diego, 2017). No amendments to zoning designations, Special Area Regulations, or Animal Regulations are needed to accommodate the project.

The environmental impact report for the General Plan analyzed the impacts of all growth projected under the General Plan. The project is consistent with all applicable General Plan policies and has been designed to implement all applicable General Plan mitigation measures related to air quality. Because the project is consistent with the projected growth of the General Plan and with the applicable General Plan air quality policies and mitigation measures, the project will not result in a significant cumulative impact to air quality. Therefore, the project would be consistent with the RAQS and SIP.

#### 4.6 Conclusion of Findings

Based upon the analysis of construction and operation activities for the proposed project would generate less than significant direct operational and direct construction impacts.

As a condition of approval, the proposed project would utilize Tier 3 or better diesel equipment with DPF. Diesel particulate matter from the project was not found to increase cancer risks greater than 10 per million exposed. Since Tier 3 equipment with DPF is considered T-BACT equipment, this potential health risk impact would be less than significant.

The Project property has multiple zoning and land use designations and the proposed project would be consistent with overall densities allowed by the General Plan for the site. The Project seeks a major use permit for the residential uses and one for the equestrian uses which will formalize the operational requirements for each set of uses. The Project's

overall or combined buildout of 396 units would be consistent with the existing General Plan Land Use Designations allowing 402 units. Additionally, the Project would be consistent with existing zoning designations of A70 (Limited Agricultural Use), S80 (Open Space), and RV (Variable Family Residential), to include all applicable Special Area Regulations, and Animal Regulations (County of San Diego, 2017). No amendments to zoning designations, Special Area Regulations, or Animal Regulations are needed to accommodate the project and less than significant impacts would be expected. Therefore, the project would be consistent with the RAQS and SIP.

Project design features (PDFs) have been included in this project. The applicant has agreed to implement all PDFs and will be included in the project's Conditions of Approval. The following PDFs are included.

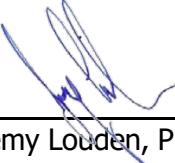

- Project-related construction activities were assumed to use Tier 3 or better U.S.EPA/CARB-certified construction equipment with DPF and was modeled as such within this analysis.
- As a design feature, the proposed project would utilize no more than 6 tons of ammonium nitrate per blast and would not blast an area greater than 20,000 SF per day.
- The Project will only install Natural Gas fireplaces within all 396 residential units.
- The Project will provide disclosures to future residents that the existing Equestrian Facility operations may cause agricultural odors typical of equestrian uses.
- The project will utilize architectural coatings compliant with San Diego Air Pollution Control District (SDAPCD) Rule 67 (SDAPCD, 2015).

## Ocean Breeze Ranch 2030 Operations - San Diego County, Summer

Project Characteristics - rps for fully operational year 2030 50% RPS

Land Use - Proposed project... Project Engineer estimated 32 acres of paving

Construction Phase - Project Construction Durations

Off-road Equipment - construction equipment

Trips and VMT - Project soil export and import hauling length would be from moving material onsite.

Demolition -

Grading - 945000 cf onsite earthwork haulage... 1,500' only though 0.5 mile was assumed. 312 ac with multiple passes

Architectural Coating - rule 67 paint

Vehicle Trips - per TS 396 units to generate 3,990 trips 10.08 trips per average unit. Parks would be primarily for project usage and would not generate trips per TS

Woodstoves - PDF - All fireplaces are Natural Gas

Area Coating - rule 67 paint

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation - Tier 3 with DPF

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix -

## Ocean Breeze Ranch 2030 Operations - San Diego County, Winter

Project Characteristics - rps for fully operational year 2030 50% RPS

Land Use - Proposed project... Project Engineer estimated 32 acres of paving

Construction Phase - Project Construction Durations

Off-road Equipment - construction equipment

Trips and VMT - Project soil export and import hauling length would be from moving material onsite.

Demolition -

Grading - 945000 cf onsite earthwork haulage... 1,500' only though 0.5 mile was assumed. 312 ac with multiple passes

Architectural Coating - rule 67 paint

Vehicle Trips - per TS 396 units to generate 3,990 trips 10.08 trips per average unit. Parks would be primarily for project usage and would not generate trips per TS

Woodstoves - PDF - All fireplaces are Natural Gas

Area Coating - rule 67 paint

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation - Tier 3 with DPF

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix -

## Ocean Breeze Ranch 2030 Operations - San Diego County, Annual

Project Characteristics - rps for fully operational year 2030 50% RPS

Land Use - Proposed project... Project Engineer estimated 32 acres of paving

Construction Phase - Project Construction Durations

Off-road Equipment - construction equipment

Trips and VMT - Project soil export and import hauling length would be from moving material onsite.

Demolition -

Grading - 945000 cf onsite earthwork haulage... 1,500' only though 0.5 mile was assumed. 312 ac with multiple passes

Architectural Coating - rule 67 paint

Vehicle Trips - per TS 396 units to generate 3,990 trips 10.08 trips per average unit. Parks would be primarily for project usage and would not generate trips per TS

Woodstoves - PDF - All fireplaces are Natural Gas

Area Coating - rule 67 paint

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation - Tier 3 with DPF

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

Fleet Mix -

EMFAC 2014 Emission Rates – San Diego County (2030)

## EMFAC2014 (v1.0.7) Emission Rates

Region Type: Air District

Region: San Diego County APCD

Calendar Year: 2030

Season: Annual

Vehicle Classification: EMFAC2007 Categories

Units: miles/day for VMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HTSK and RUNLS, g/vehicle/day for IDLEX, RESTL and DIURN

Region	CalYr	VehClass	MdlYr	Speed	Fuel	Population	VMT	Trips	CO_IDLEX	CO_STREX	Total CO Grams
