Re: 426 Palm Canyon Drive, Borrego Springs, CA 92004 (PDS2021-STP-21-016)

I Paul Fisher, RCE No. 71549 certify that the grading shown on the preliminary grading plan for the subject project will not alter the drainage patterns from the existing condition to the graded condition. This grading will not increase the volume and the velocity of the surface flows to the detriment of downstream land owners and facilities. The grading shown will not alter the course of a stream or river, or increase the rate or amount of surface runoff in a manner which would result in flooding onsite or offsite. The runoff rate comparison from pre-development to post development shows a net zero affect to stormwater runoff due to the fact that minimal impervious area was added during construction. Proposed grades will mimic historical topographical grades thereby reverting flows back to their natural sheet flow state. No drainage will be concentrated once the grading has taken place, and downstream energy dissipation devices will not be necessary.

If you have any further concern regarding this certification please use my contact information provided below, thank you for your consideration in the approval of this project.

Sincerely,

Paul Fisher, PE, President
