**RE: Air Quality and Greenhouse Gas Addendum Letter PDS2023-TM-5615TER -
Ocean Breeze Ranch Revised Tentative Map Time Extension - County of San Diego**

The proposed Project seeks to modify the previously approved Tentative Map 5615 which was approved by the Planning Commission on December 13, 2019. The approved project, also named Ocean Breeze Ranch, includes a 396 planned residential development (PRD) and a private equestrian facility which would be developed over three planning areas (PA1, PA2, and PA3). The PRD would also include parks, roads and landscaped areas. The equestrian facility consists primarily of previously constructed buildings and structures.

The proposed Project would modify 86 lot lines (57 residential lots, 25 open space lots and 2 public park lots and 2 private park lots); lower building pad elevations PA1 and PA3 while raising elevations at PA2. In addition, the proposed Project would realign Street B and utilities to accommodate the modifications.

Earthwork for the approved Tentative Map 5615 consisted of 1,900,000 cubic yards (CY) of even cut and fill with no export required. The proposed Project modification would increase the earthwork to approximately 2,500,000 CY and would remain balanced.

The purpose of this air quality and greenhouse gas addendum letter is to compare the construction emissions from what was calculated and expected in the original air quality and greenhouse gas studies to a new scenario which includes additional earthwork onsite with 2,500,000 CY of earthwork. Operationally, the proposed Project and the existing approved project are identical.

The methodology uses the same models using the CalEEMod 2016.3.2 software used in the approval of the original air quality and greenhouse gas analysis approved under California Environmental Quality Act (CEQA). This methodology provides a good comparison with what was approved and what is now proposed which has a higher grading quantity and demonstrates the increased impact expected from the new grading quantity. In addition, this analysis also provides a comparison using the latest CalEEMod 2022.1 model which also compares the scenario with only 1,900,000 CY of earthwork with the revised 2,500,000 CY earthwork scenario.

This mode demonstrates the relative differences between the older 2016 model and the latest model South Coast Air Quality Management District (SCAQMD) has adopted.

The 2022.1 model includes the same Project definitions, durations, equipment, horsepower, grading, acreage, onsite earthwork and project features as was also modeled in using the 2016.3.2 model with the exception of default model emission factors used to calculate Project emission.

Project Related Construction Emissions

The approved Project construction dates were estimated based on a construction kickoff in 2022 with construction ending sometime late 2029. The models were all updated with construction dates being pushed three years forward or starting in 2025 and ending in 2032. With the exception of Project grading and the forward construction dates, the Project description is essentially the same as was previously approved.

Air Quality

Table 1 below shows the maximum seasonal air quality emissions reported in the original analysis using CalEEMod 2016.3.2 for both the winter and summer months and then selects the yearly maximum emission to use as a comparison with blasting (**See Attachment A**). The table also identifies what the emissions do when the construction start dates are shifted forward in duration by three years and compares the results with the maximum yearly emission of the revised Project with 2,500,000 CY of material. Based on these results, emissions would only marginally increase and would remain less than significant. The additional modeling shifting the construction start date forward with the increased grading quantities is provided in **Attachment B**.

Finally, since the County now recommends CalEEMod 2022.1 as the primary air quality for CEQA analysis, a model was prepared which compares both the existing approved project with the proposed project with the increased grading quantities. Table 1 also shows the maximum yearly emissions from each scenario. Based on these findings, the new default emission rates used by CalEEMod 2022.1 are different but largely demonstrates that the emission would be very similar to what was previously approved. The model output from the existing approved scenario with the proposed revised scenario are provided as **Attachments C and D**.

Construction emissions which produce diesel particulate matter (DPM) could have the potential to increase health risks for nearby receptors. The nearest sensitive receptors are between 140 and 300 meters away from the project grading boundaries and include the nearby school and residences to the south of the project. In addition, the project design features which are a condition of the Project, mandate the use of at least Tier 3 construction equipment with diesel particulate filters (DPF) attached. The original approved analysis found that cancer risks related to DPM would be 4.61 per one million exposed which is less than significant. Since the expected emissions as demonstrated in Table 1 above do not significantly increase, no significant increase to the estimate health risk would be expected. Furthermore, non-cancer risks (Acute) would also remain less than significant.

Greenhouse Gas

Table 2 below shows the expected yearly GHG emission as identified in the approved Greenhouse Gas Assessment. Based on the numbers, the Project would generate 18,114.87 MT CO₂e total or 603.83 MT CO₂e annually (See **Attachment E**).

Table 2: Approved Project Construction CO₂e Emissions Summary (MT/Year)

Total						18,114.87
Yearly Average Construction Emissions (Metric Tons/year over 30 years)						603.83
Expected Construction emissions are based upon CalEEMod modeling for equipment listed in Table 4.1 above.						

Table 3 below shows the revised construction model which increases the earthwork to 2,500,000 CY over the earthwork phases of the Project. Based on the model outputs (See **Attachment F**), the first two years of construction would increase GHG emissions however, over the remaining construction years, a GHG emissions reduction would be expected. Based on the revised model output, the cumulative construction emissions would be 17,690.88 MT CO₂e over the entire construction duration or an annual GHG emission of 589.70 MT CO₂e per year. Based on this, since cumulative GHG emissions would decrease cumulatively over the entire construction duration the proposed Project would generate a less than significant GHG impact. In addition, it should be noted that construction operations beyond what is proposed would not be expected, therefore, no new impacts would occur.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	18.4	annual days of extreme heat
Extreme Precipitation	5.10	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	46.1	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{1}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters.

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	18.4	annual days of extreme heat
Extreme Precipitation	5.10	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	46.1	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	N/A	N/A	N/A	N/A
-------------------------	-----	-----	-----	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores
